DESIGN AND ANALYSIS OF ALGORITHMS

CSA0672

1 . Identify the M-th maximum number and Nth minimum number in an array and then find the sum of it and difference of it.

Test cases:	output –
{16, 16, 16 16, 16}, M = 0, N = 1	(illegal input)
{0, 0, 0, 0}, M = 1, N = 2	0
{-12, -78, -35, -42, -85}, M = 3 , N = 3	-7
{15, 19, 34, 56, 12}, M = 6 , N = -3	(illegal input)
{85, 45, 65, 75, 95}, M = 5 , N = 2	-20

Program:

```c
#include<stdio.h>

int main(){
    int size=0;
    printf("Enter the total no. of elements: ");
    scanf("%d",&size);

    int arr[size];
    printf("Enter the elements: ");
    for (int i = 0; i < size; i++)
     scanf("%d",&arr[i]);

    int n,m;
    printf("Enter the m value: ");
    scanf("%d",&m);
    printf("Enter the n value: ");
    scanf("%d",&n);

    if(m<=0 || n<=0)
     printf("illegal input...!");

    else if(m>size || n<0)
     printf("illegal input...!");

    else{
        int temp=0;

        for(int i=0;i<size;i++){
            for(int j=0;j<size;j++){
                temp=arr[i];
                arr[i]=arr[j];
```

```
        arr[j]=temp;
      }
    }

    printf("Sum: %d\n",arr[size-m]+arr[n-1]);
    printf("Difference: %d",arr[size-m]-arr[n-1]);
  }

}
```

Output:

2.   **Given an array of integers nums which is sorted in ascending order, and an integer target, write a function to search target in nums. If target exists, then return its index. Otherwise, return -1.integer target. Write a program to search a number in a list using binary search and estimate time complexity**

Program:

```
#include<stdio.h>
int main()
{
   int c=0;
   int n,k,i,low,high,mid,a[50],temp;
   printf("Enter number of elements:");
   scanf("%d",&n);
   printf("Enter elements:\n");
   for(i=0;i<n;i++)
   {
```

```
      c++;
      scanf("%d",&a[i]);
   }
   c++;
   printf("Enter Element to search:");
   scanf("%d",&k);
   low=0;  c++;
   high=n-1;  c++;
   mid=low+high/2;  c++;
   c++;
   while(low<=high)
   {
      c++;
      c++;
      if(a[mid]<k)
      {
         low=mid+1;  c++;
      }
      else if(a[mid]==k)
      {
         printf("\nElement is found at index %d\n",mid);
         break;
      }
      else
      {
         high=mid-1;  c++;
      }
      mid=(low+high)/2;  c++;
   }
   c++;
   c++;
   if(low>high)
   {
      printf("Element is not found\n");
   }
   printf("\nTime Complexity : %d\n",c);
}
```

Output:

3.Write a program to find the reverse of a given number.Estimate the time complexity for the following inputs

       a. 1234   b. 6789456   c. 45a34   d – 5926

Program:

```c
#include <stdio.h>

int main() {

 int n, reverse = 0, remainder;

 printf("Enter an integer: ");
 scanf("%d", &n);

 while (n != 0) {
   remainder = n % 10;
   reverse = reverse * 10 + remainder;
   n /= 10;
 }

 printf("Reversed number = %d", reverse);

 return 0;
}
```
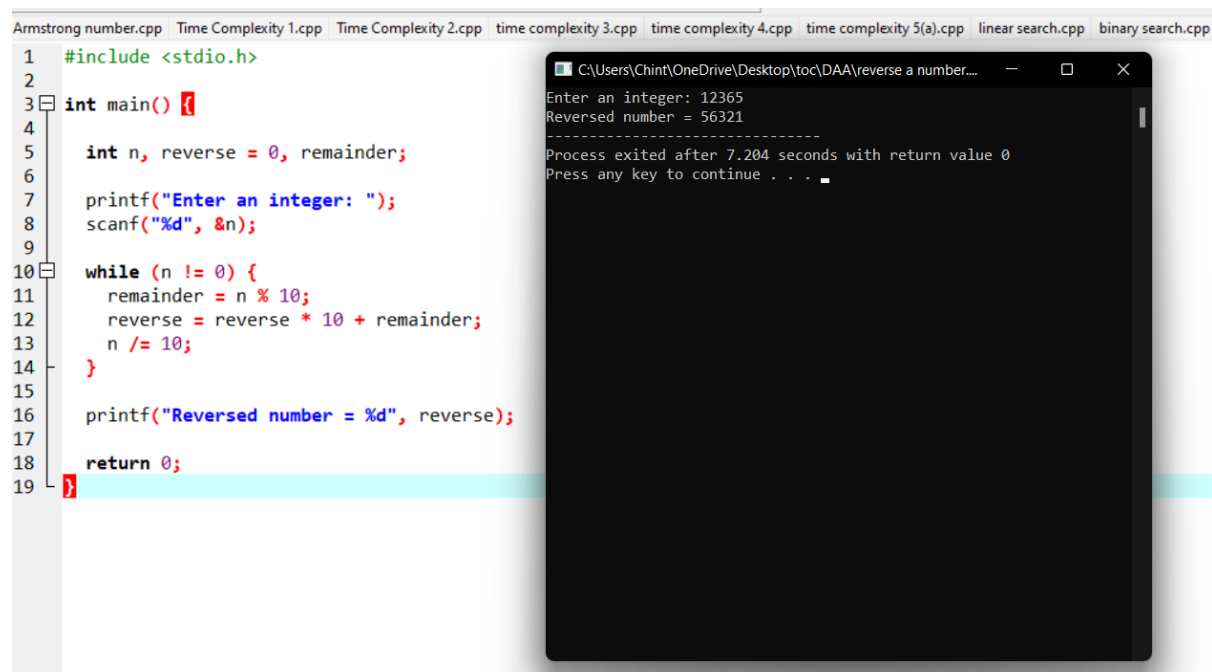

Output:

Armstrong number.cpp   Time Complexity 1.cpp   Time Complexity 2.cpp   time complexity 3.cpp   time complexity 4.cpp   time complexity 5(a).cpp   linear search.cpp   binary search.cpp

```
1    #include <stdio.h>
2
3    int main() {
4
5        int n, reverse = 0, remainder;
6
7        printf("Enter an integer: ");
8        scanf("%d", &n);
9
10       while (n != 0) {
11           remainder = n % 10;
12           reverse = reverse * 10 + remainder;
13           n /= 10;
14       }
15
16       printf("Reversed number = %d", reverse);
17
18       return 0;
19   }
```

```
C:\Users\Chint\OneDrive\Desktop\toc\DAA\reverse a number....    —    □    ×

Enter an integer: 12365
Reversed number = 56321
---------------------------------
Process exited after 7.204 seconds with return value 0
Press any key to continue . . . _
```

4.Write a program to perform sum of subsets problem using backtracking and estimate time complexity. Identify the test cases.

A. Set (s) = (6, 2,8,1,5)   sum is 9   B..   Set (s) = (6, -4, 7,-1,5, 2,8,1,)   sum is 10

Program:

```c
#include <stdio.h>
#define TRUE 1
#define FALSE 0
int inc[50],w[50],sum,n,count=0;
void sumset(int i,int wt,int total);
int promising(int i,int wt,int total) {
        return(((wt+total)>=sum)&&((wt==sum)||(wt+w[i+1]<=sum)));
}
int main() {
        int i,j,n,temp,total=0;
        printf("\n Enter how many numbers:\n");
        scanf("%d",&n);
        printf("\n Enter %d numbers to th set:\n",n);
        for (i=0;i<n;i++) {
                scanf("%d",&w[i]);
                total+=w[i];
        }
        count++;
        printf("\n Input the sum value to create sub set:\n");
        scanf("%d",&sum);
        for (i=0;i<=n;i++)
          for (j=0;j<n-1;j++)
           if(w[j]>w[j+1]) {
                temp=w[j];
                w[j]=w[j+1];
                w[j+1]=temp;
        }
        count++;
        printf("\n The given %d numbers in ascending order:\n",n);
        for (i=0;i<n;i++)
          printf("%d \t",w[i]);
          count++;
        if((total<sum))
          printf("\n Subset construction is not possible"); else {
                for (i=0;i<n;i++)
                  inc[i]=0;
                printf("\n The solution using backtracking is:\n");
                sumset(-1,0,total);
        }
        count++;

}
void sumset(int i,int wt,int total) {
        int j;
        if(promising(i,wt,total)) {
```

```
                if(wt==sum) {
                        printf("\n{\t");
                        for (j=0;j<=i;j++)
                           if(inc[j])
                             printf("%d\t",w[j]);
                        printf("}\n");
                } else {
                        inc[i+1]=TRUE;
                        sumset(i+1,wt+w[i+1],total-w[i+1]);
                        inc[i+1]=FALSE;
                        sumset(i+1,wt,total-w[i+1]);
                }
        }
        printf(" time complexity is%d\n",count);
}
```

Output:

5. **Write a program to check the given is Armstrong or not.**
   The k-digit number N is an Armstrong number if and only if the k-th power of each digit sums to N.
   Given a positive integer N, return true if and only if it is an Armstrong number.

   Input : 153   **Input : 419**
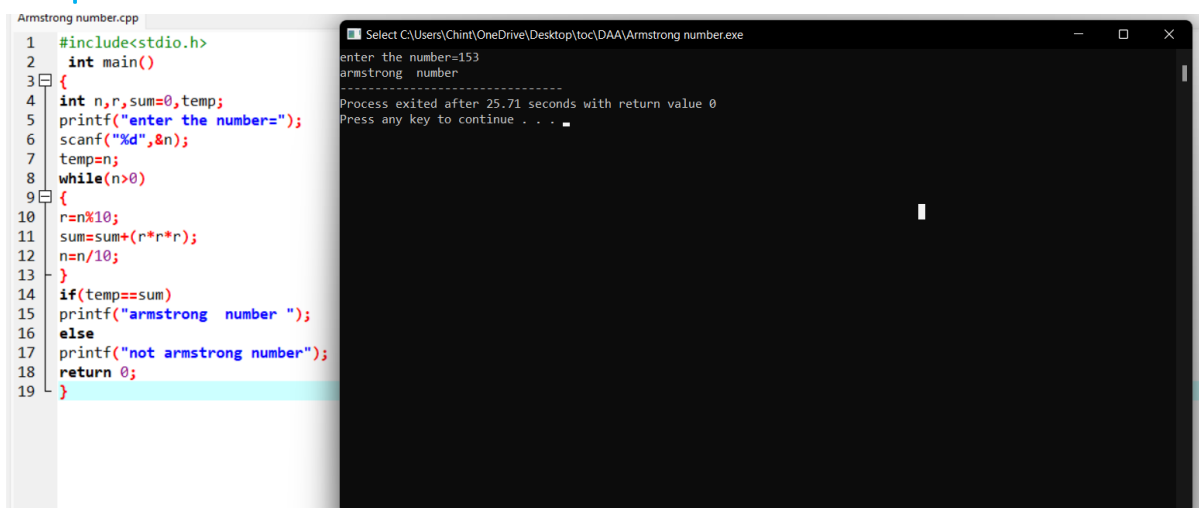

Output : True   **Output : False**

Program:

1. #include<stdio.h>
2. int main()
3. {
4. int n,r,sum=0,temp;
5. printf("enter the number=");
6. scanf("%d",&n);
7. temp=n;
8. while(n>0)
9. {
10. r=n%10;
11. sum=sum+(r*r*r);
12. n=n/10;
13. }
14. if(temp==sum)
15. printf("armstrong number ");
16. else
17. printf("not armstrong number");
18. return 0;
19. }

Output:

6.   **Write a C program to perform Strassen's Matrix Multiplication for the 2*2 matrix elements.**
        And Estimate time complexity.

A Matrix= (3, 5,-4, 7)   B Matrix – (9,-2, 4, 8)

Program:

```c
#include<stdio.h>
        int main(){
        int a[2][2], b[2][2], c[2][2], i, j,count=0;
        int m1, m2, m3, m4 , m5, m6, m7;
        printf("Enter the 4 elements of first matrix:");

    printf("%d is also prinme number",sum);
  }
  else
  {
    count++;
    printf("%d is Not Prime number\n",sum);
  }
  count++;
  printf("time complexity:%d\n",count);

}
```

Output:

```
C:\Users\Chint\OneDrive\Desktop\toc\DAA\prime.exe                          —    □    ×

Enter the prime number:504

405 is Not Prime number
time complexity:17

--------------------------------
Process exited after 4.794 seconds with return value 0
Press any key to continue . . . ▪
```

8. Let there be N workers and N jobs. Any worker can be assigned to perform any job, incurring some
    cost that may vary depending on the work-job assignment. It is required to perform all jobs by
    assigning exactly one worker to each job and exactly one job to each agent in such a way that the
total cost of the assignment is minimized. Write a program to solve a assignment problem for the
    given data sets using branch and bound.

	Job 1	Job 2	Job 3	Job 4

Person A	12	8	9	10
Person B	11	10	10	9
Person C	9	11	8	12
Person D	11	9	23	7

Program:

```c
#include <stdbool.h>
#include <stdio.h>
#include <stdlib.h>

typedef struct Job {

        char id;
        int dead;
        int profit;
} Job;
int compare(const void* a, const void* b)
{
        Job* temp1 = (Job*)a;
        Job* temp2 = (Job*)b;
        return (temp2->profit - temp1->profit);
}

int min(int num1, int num2)
{
        return (num1 > num2) ? num2 : num1;
}

void printJobScheduling(Job arr[], int n)
{

        qsort(arr, n, sizeof(Job), compare);

        int result[n];
        bool slot[n];
        for (int i = 0; i < n; i++)
                slot[i] = false;

        for (int i = 0; i < n; i++) {

                for (int j = min(n, arr[i].dead) - 1; j >= 0; j--) {

                        if (slot[j] == false) {
                                result[j] = i;
                                slot[j] = true;
                                break;
                        }
                }
        }

        for (int i = 0; i < n; i++)
```

```
                    if (slot[i])
                            printf("%c ", arr[result[i]].id);
}

int main()
{
        Job arr[] = { {'a', 12, 8, 9, 10 },
                            { 'b', 11, 10, 10, 9 },
                            { 'c', 9, 11, 8, 12 },
                            { 'd', 11, 9, 23, 7 } };
        int n = sizeof(arr) / sizeof(arr[0]);
        printf(
                "Following is maximum profit sequence of jobs \n");

        printJobScheduling(arr, n);
        return 0;
}
```

Output:

Output

/tmp/WKZixmdBgw.o
Following is maximum profit sequence of jobs
a d b c

9. Compute the program to find the GCD of two numbers. And also find the finf of time Recursion

   used to estimate time complexity.

   Perform the test cases for the given set of no's

   A.   (36,48)   B. (144, 90)   C. (-56,88)   D. (84,84)
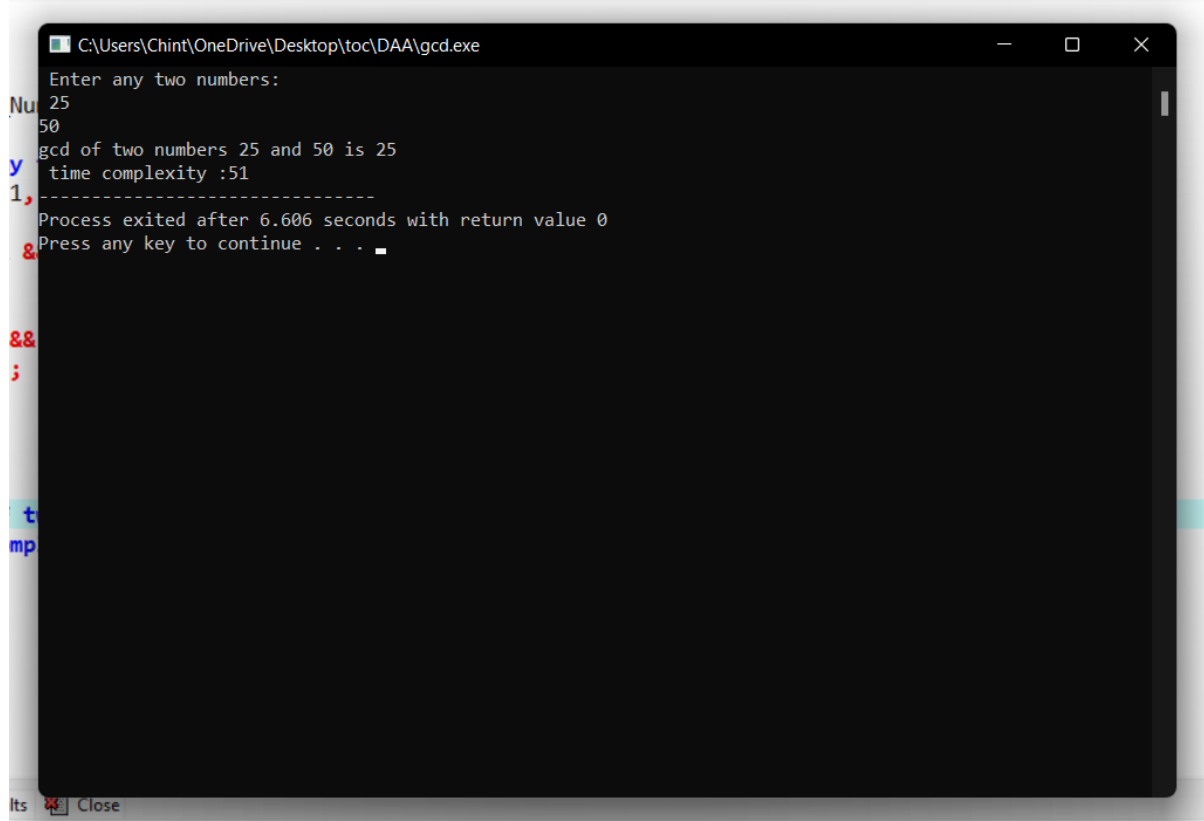

Program:

```
#include <stdio.h>
int main()
{
   int n1, n2, i, GCD_Num;
   int count=0;
   printf ( " Enter any two numbers: \n ");
   scanf ( "%d %d", &n1, &n2);

   for( i = 1; i <= n1 && i <= n2; ++i)
   {
      count++;
      if (n1 % i ==0 && n2 % i == 0)
         GCD_Num = i;
```

```
        count++;
    }
                count++;

    printf ("gcd of two numbers %d and %d is %d \n ", n1, n2, GCD_Num);
    printf("time complexity :%d ",count);
    return 0;
}
```

Output:

10. Using Divide and Conquer strategy to find Max and Min value in the list and estimate time

   complexity.

   Testing Condition – Count the number of times in Comparion to find Min_Max value

   in a list n for the given set of elements.

     A.   **(23,45,6,8,-9,44,7,8)**

 5   1   5  10  10   5   1
Time complexity:54
-------------------------------
```
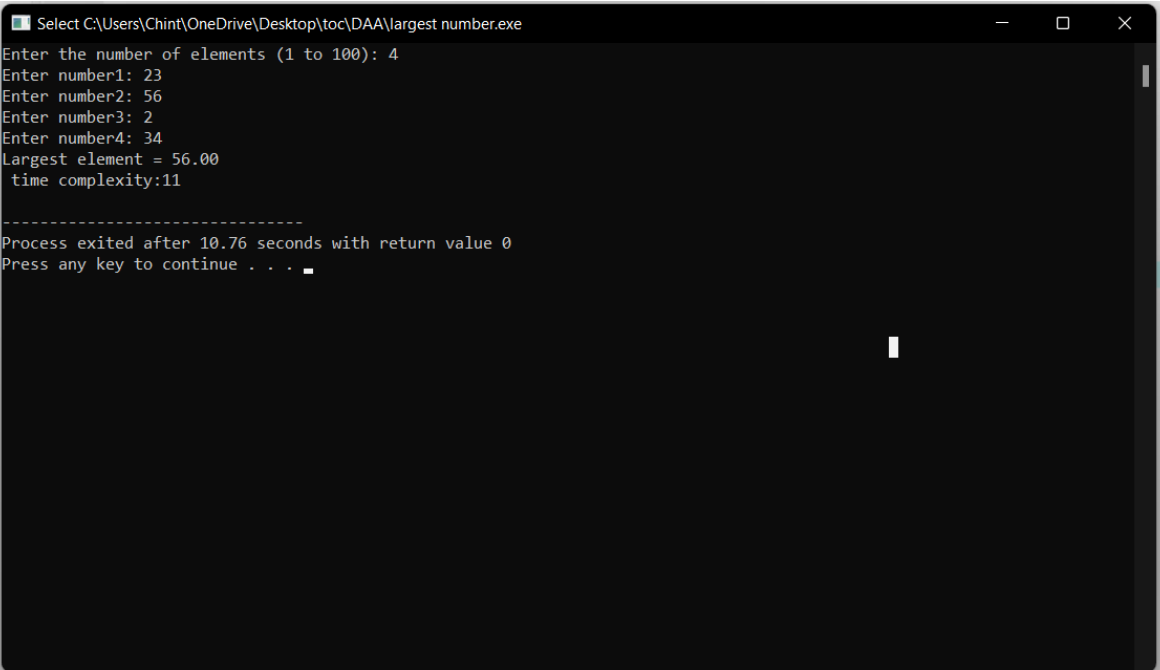

13. Write a program to find the largest element value in an array. Estimate the time complexity and no of

comparison for the given set of values.

Program:

```c
#include <stdio.h>
int main() {
  int n;
  int count=0;
  double arr[100];
  printf("Enter the number of elements (1 to 100): ");
  scanf("%d", &n);
  count++;
  for (int i = 0; i < n; ++i) {
        count++;
    printf("Enter number%d: ", i + 1);
```

```
    scanf("%lf", &arr[i]);
  }
  for (int i = 1; i < n; ++i) {
        count++;
    if (arr[0] < arr[i]) {
      arr[0] = arr[i];
    }
    count++;
  }

  printf("Largest element = %.2lf \n ", arr[0]);
  printf("time complexity:%d\n",count);
  return 0;
}
```

Output:

14. **Consider a two integer arrays nums1 and nums2, sorted in non-increasing order and two integers m**

   and n, representing the number of elements in nums1 and nums2 respectively. Write a program to

   Merge them into a single array using Merge Sort. Derive time complexity of merge sort.

Program:

```c
#include <stdio.h>
#include <stdlib.h>

// Merges two subarrays of arr[].
// First subarray is arr[l..m]
// Second subarray is arr[m+1..r]
void merge(int arr[], int l,
                int m, int r)
{
```

```
int i, j, k;
int n1 = m - l + 1;
int n2 = r - m;

// Create temp arrays
int L[n1], R[n2];

// Copy data to temp arrays
// L[] and R[]
for (i = 0; i < n1; i++)
        L[i] = arr[l + i];
for (j = 0; j < n2; j++)
        R[j] = arr[m + 1 + j];

// Merge the temp arrays back
// into arr[l..r]
// Initial index of first subarray
i = 0;

// Initial index of second subarray
j = 0;

// Initial index of merged subarray
k = l;
while (i < n1 && j < n2)
{
        if (L[i] <= R[j])
        {
                arr[k] = L[i];
                i++;
        }
        else
        {
                arr[k] = R[j];
                j++;
        }
        k++;
}

// Copy the remaining elements
// of L[], if there are any
while (i < n1) {
        arr[k] = L[i];
        i++;
        k++;
}

// Copy the remaining elements of
// R[], if there are any
while (j < n2)

Sorted array is 1 2 4 5 6

----

22. Determine an optimal tour in a weighted, directed graph. The weights are nonnegative numbers. The
    inputs are weighted, directed graph, and n, the number of vertices in the graph. The graph is
    represented by a two-dimensional array W, which has both its rows and columns indexed from 1 to n,
    where W [i] [j] is the weight on the edge from the ith vertex to the jth vertex. Write a

program for
travelling salesman problem using dynamic programming for the below given graph.
Program:

```cpp
#include <iostream>

using namespace std;
const int n = 4;
const int MAX = 1000000;
int dist[n + 1][n + 1] = {
    { 0, 0, 0, 0, 0 },   { 0, 0, 10, 15, 20 },
    { 0, 10, 0, 25, 25 }, { 0, 15, 25, 0, 30 },
    { 0, 20, 25, 30, 0 },
};

int memo[n + 1][1 << (n + 1)];

int fun(int i, int mask)
{

    if (mask == ((1 << i) | 3))
        return dist[1][i];

    if (memo[i][mask] != 0)
        return memo[i][mask];

    int res = MAX;

    for (int j = 1; j <= n; j++)
        if ((mask & (1 << j)) && j != i && j != 1)
            res = std::min(res, fun(j, mask & (~(1 << i)))
                            + dist[j][i]);
    return memo[i][mask] = res;
}

int main()
{
    int ans = MAX;
    for (int i = 1; i <= n; i++)
        ans = std::min(ans, fun(i, (1 << (n + 1)) - 1)
                        + dist[i][1]);

    printf("The cost of most efficient tour = %d", ans);
```
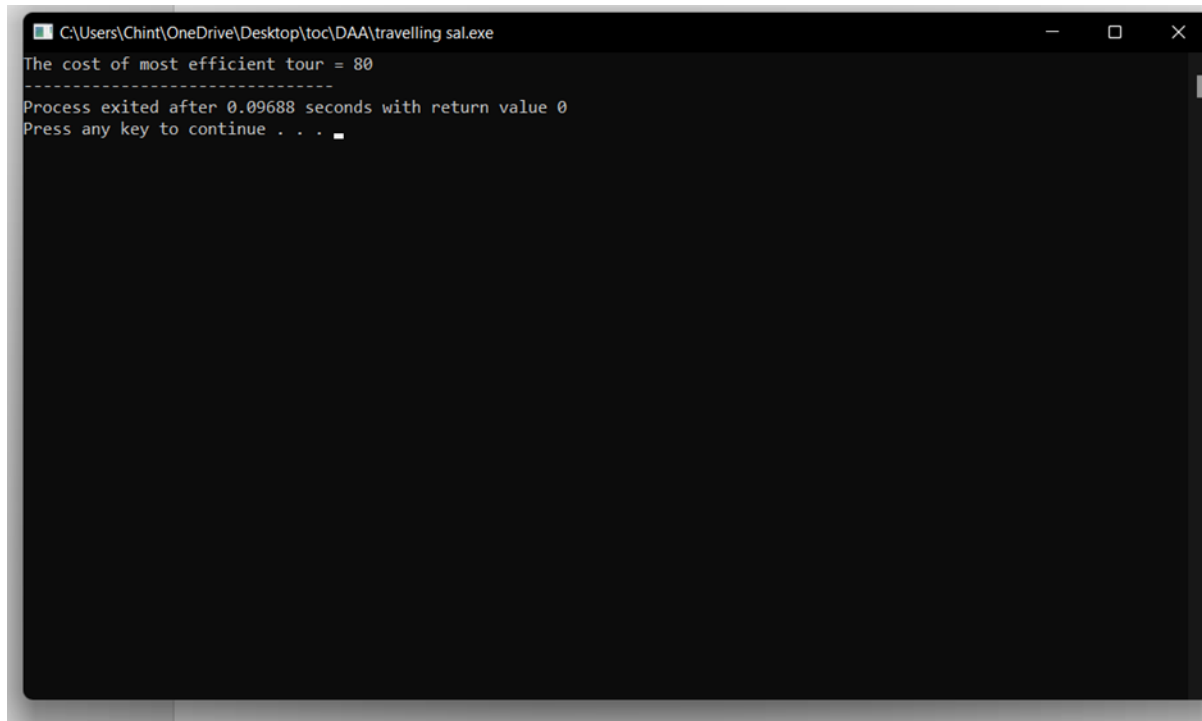

```
    return 0;
}
```

Output:

23. Write a program using choice to check

       Case 1: Given string is palindrome or not
       Case 2: Given number is palindrome or not
       Sample Input:
       Case = 1
       String = MADAM
       Sample Output:
       Palindrome
       Test cases:
       1.   MONEY

       2.   5678765

       3.   MALAY12321ALAM

       4.   MALAYALAM

       5.   1234.4321

Program:

```
#include <stdio.h>
#include <string.h>
        int main(){
   char string1[20];
   int i, length;
   int flag = 0;
```
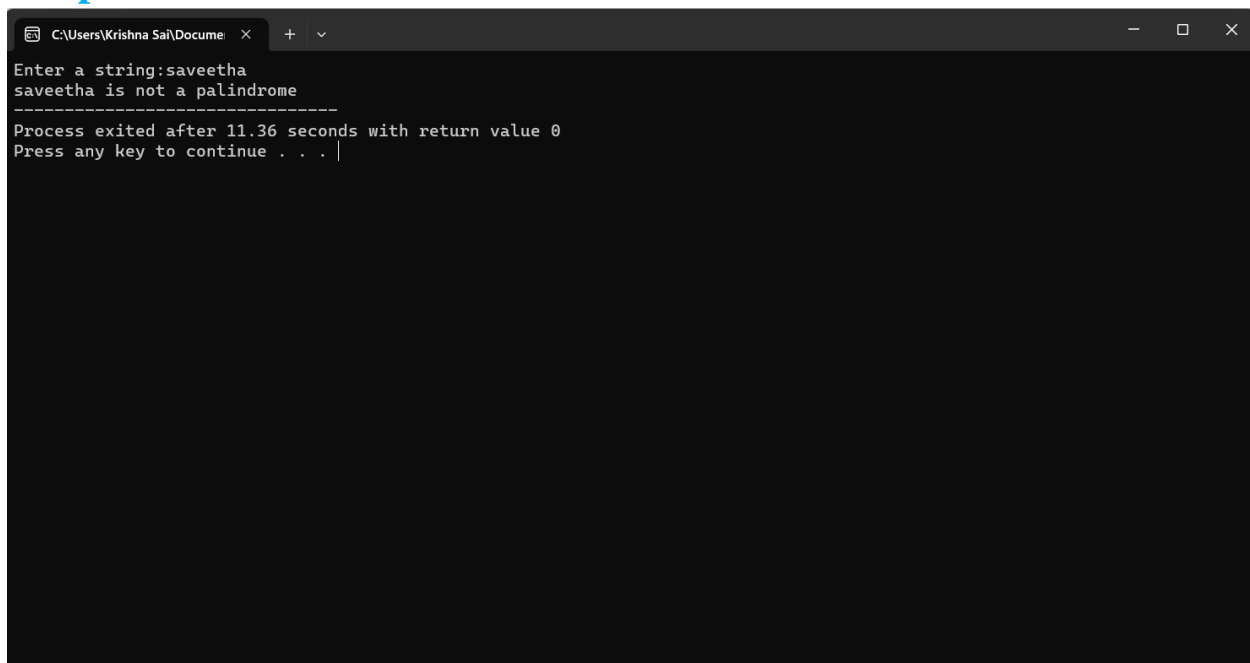

```

}
else {
    printf("%s is a palindrome", string1);
}
return 0;
}
```

Output:

```
Enter a string:saveetha
saveetha is not a palindrome
------------------------------
Process exited after 11.36 seconds with return value 0
Press any key to continue . . .
```

24. Write a program to inset a number in a list

Testing Condition

   i. Insert at the beginning

   ii. Insert in the middle

    iii. Insert at the last
    iv. Not Available position in a list

Program:

```c
#include<stdio.h>
#include<stdlib.h>

#define MAX 100

int list[MAX];
int position, num, size = 0;

void insertAtBeginning() {
 int i;
 if (size == MAX) {
   printf("List is full. Cannot insert at the beginning\n");
   return;
 }

 for (i = size; i > 0; i--) {
   list[i] = list[i - 1];
 }

 list[0] = num;
 size++;
 printf("Number %d inserted at position %d\n", num, position);
}

void insertInMiddle() {
 int i;
 if (size == MAX) {
   printf("List is full. Cannot insert in the middle\n");
   return;
 }

 for (i = size; i > position - 1; i--) {
   list[i] = list[i - 1];
 }

 list[position - 1] = num;
 size++;
 printf("Number %d inserted at position %d\n", num, position);
}

void insertAtLast() {
 if (size == MAX) {
   printf("List is full. Cannot insert at the end\n");
   return;
 }

 list[size] = num;
 size++;
 printf("Number %d inserted at position %d\n", num, size);
}
```

```c
int main() {
  int choice;
  while (1) {
    printf("1. Insert at the beginning\n");
    printf("2. Insert in the middle\n");
    printf("3. Insert at the last\n");
    printf("4. Exit\n");
    printf("Enter your choice: ");
    scanf("%d", &choice);

    switch (choice) {
      case 1:
        printf("Enter the number to insert: ");
        scanf("%d", &num);
        position = 1;
        insertAtBeginning();
        break;

      case 2:
        printf("Enter the number to insert: ");
        scanf("%d", &num);
        printf("Enter the position to insert the number: ");
        scanf("%d", &position);
        if (position < 1 || position > size + 1) {
          printf("Invalid position\n");
        } else {
          insertInMiddle();
        }
        break;

      case 3:
        printf("Enter the number to insert: ");
        scanf("%d", &num);
        position = size + 1;
        insertAtLast();
        break;

      case 4:
        exit(0);

      default:
        printf("Invalid choice\n");
        break;
    }
  }

  return 0;
}
```

Output:

Insert at the beginning
2. Insert in the middle
3. Insert at the last

4. Exit
Enter your choice: 1
Enter the number to insert: 5
Number 5 inserted at position 1
1. Insert at the beginning
2. Insert in the middle
3. Insert at the last
4. Exit
Enter your choice: 2
Enter the number to insert: 6
Enter the position to insert the number: 2
Number 6 inserted at position 2
1. Insert at the beginning
2. Insert in the middle
3. Insert at the last
4. Exit
Enter your choice: 3
Enter the number to insert: 4
Number 4 inserted at position 3
1. Insert at the beginning
2. Insert in the middle
3. Insert at the last
4. Exit
Enter your choice: 4

25.The n-queens puzzle is the problem of placing n queens on an n x n chessboard such that no two queens attack each other. Given an integer n, return all distinct solutions to the n-queens puzzle. You may return the answer in any order. Write a program for the same.
Program:

```
#include<stdio.h>
#include<conio.h>
#include<math.h>
int a[30],count=0;
int place(int pos) {
        int i;
        for (i=1;i<pos;i++) {
                if((a[i]==a[pos])||((abs(a[i]-a[pos])==abs(i-pos))))
                    return 0;
        }
        return 1;
}
void print_sol(int n) {
        int i,j;
        count++;
```

```c
        printf("\n\ntime comolexity  #%d:\n",count);
        for (i=1;i<=n;i++) {
                for (j=1;j<=n;j++) {
                        if(a[i]==j)
                            printf("Q\t"); else
                            printf("*\t");

        }
                printf("\n");
        }
}
void queen(int n) {
        int k=1;
        a[k]=0;
        while(k!=0) {
                a[k]=a[k]+1;
                while((a[k]<=n)&&!place(k))
                  a[k]++;
                if(a[k]<=n) {
                        if(k==n)
                            print_sol(n); else {
                                    k++;
                                    a[k]=0;
                            }
                } else
                  k--;
        }
}
main() {
        int i,n;
        printf("Enter the number of Queens\n");

Solution exists:
0 0 1 0

35.Write a program to return all the possible subsets for a given integer array. Return the

solution in any order.

Input nums= [1,2,3]
Output : [[], [1], [2], [3], [1,2], [1,3], [2,3], [1,2,3]]

Program:

```c
#include <stdio.h>
char string[50], n;
void subset(int, int, int);
 int main()
{
    int i, len;
    printf("Enter the len of main set : ");
    scanf("%d", &len);
    printf("Enter the elements of main set : ");
    scanf("%s", string);
    n = len;
    printf("The subsets are :\n");
    for (i = 1;i <= n;i++)
        subset(0, 0, i);
}
void subset(int start, int index, int num_sub)
{
    int i, j;
    if (index - start + 1  ==  num_sub)
    {
        if (num_sub  ==  1)
        {
            for (i = 0;i < n;i++)
                printf("%c\n", string[i]);
        }
        else
        {
            for (j = index;j < n;j++)
            {
                for (i = start;i < index;i++)
                    printf("%c", string[i]);
                printf("%c\n", string[j]);
```

```
        }
        if (start != n - num_sub)
            subset(start + 1, start + 1, num_sub);
      }
    }
    else
    {
      subset(start, index + 1, num_sub);
    }
}
```

Output:

Enter the len of main set : 3
Enter the elements of main set : 123
The subsets are :
1
2
3
12
13
23
123

36.Write a program to compute container loader Problem for the given values and estimate time complexity.
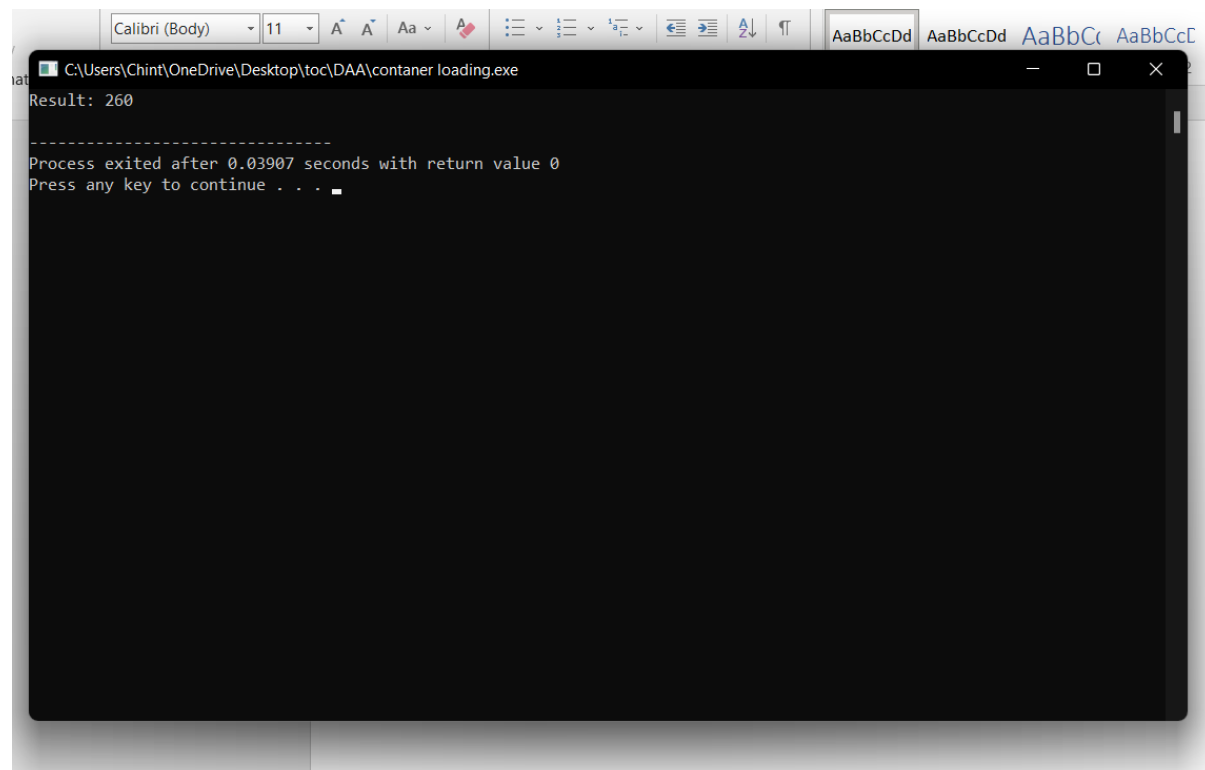

N=8 be total no of containers having weights (w1, w2, w3,…w8) = [50, 100, 30, 80, 90, 200, 150, 20].   Capacity value = 100

Program:

```c
#include <stdio.h>
#include <stdlib.h>

#define MAX_ITEMS 100
#define MAX_WEIGHT 100

int weight[MAX_ITEMS];
int value[MAX_ITEMS];
int dp[MAX_ITEMS][MAX_WEIGHT];

int max(int a, int b) {
  return (a > b) ? a : b;
}

int knapsack(int n, int w) {
  int i, j;
  for (i = 0; i <= n; i++) {
    for (j = 0; j <= w; j++) {
      if (i == 0 || j == 0) {
        dp[i][j] = 0;
      } else if (weight[i-1] <= j) {
        dp[i][j] = max(value[i-1] + dp[i-1][j-weight[i-1]], dp[i-1][j]);
      } else {
        dp[i][j] = dp[i-1][j];
```

```
    }
   }
  }
  return dp[n][w];
}

int main() {
 int n = 4;
 int w = 10;
 weight[0] = 1;
 weight[1] = 2;
 weight[2] = 3;
 weight[4] = 4;
 weight[5] = 5;
 weight[6] = 6;
 weight[7] = 7;
 weight[8] = 8;
 value[0] = 50;
 value[1] = 100;
 value[2] = 30;
 value[3] = 80;
 value[4] = 90;
 value[5] = 200;
 value[6] = 150;
 value[7] = 20;
 int result = knapsack(n, w);
 printf("Result: %d\n", result);
 return 0;
}
```

Output:

37.Write a program to find a minimum spanning tree using prims technique for the

given graph.
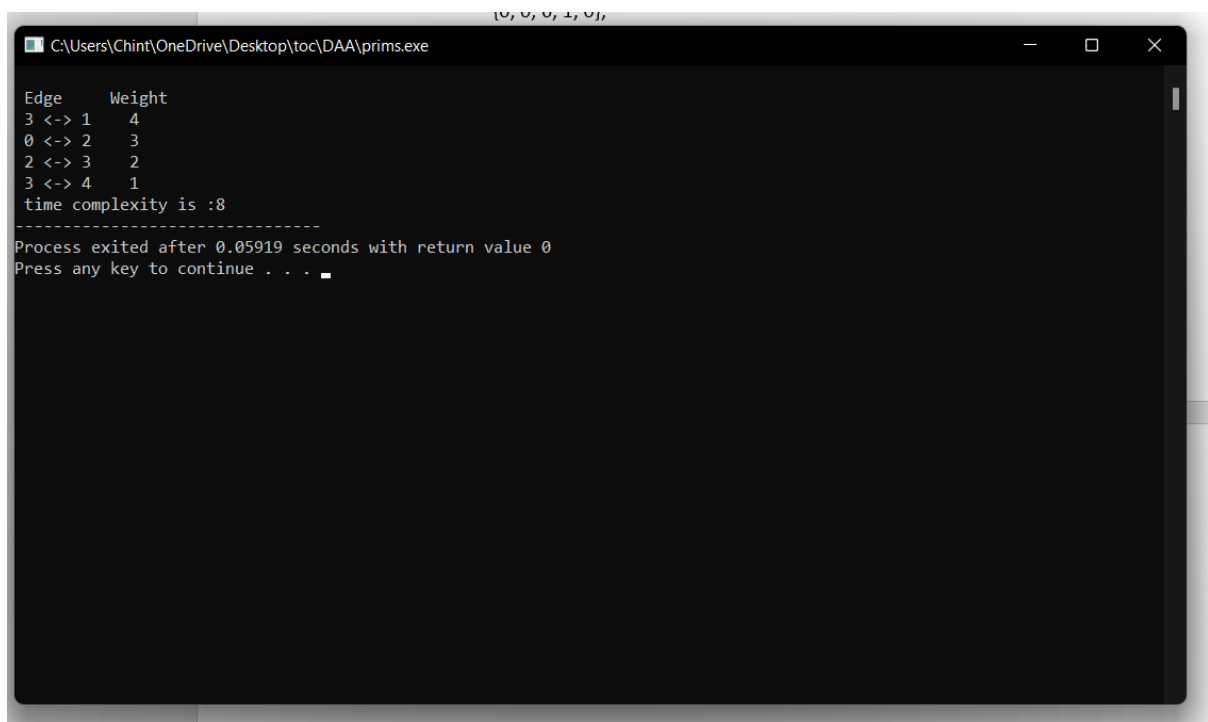

Program:

```c
#include <stdio.h>
#include <limits.h>
#define vertices 5
int minimum_key(int k[], int mst[])
{
   int minimum  = INT_MAX, min,i,count=0;
   for (i = 0; i < vertices; i++)
     if (mst[i] == 0 && k[i] < minimum )
        minimum = k[i], min = i;
   return min;
   count++;
}
void prim(int g[vertices][vertices])
{
   int parent[vertices];
   int k[vertices];
   int mst[vertices];
   int i, count,edge,v;
   for (i = 0; i < vertices; i++)
   {
     k[i] = INT_MAX;
               count++;
     mst[i] = 0;
               count++;
   }
   count++;
   k[0] = 0;
        count++;
   parent[0] = -1;
        count++;

   for (count = 0; count < vertices-1; count++)
   {
     edge = minimum_key(k, mst);
     mst[edge] = 1;
     for (v = 0; v < vertices; v++)
     {
       if (g[edge][v] && mst[v] == 0 && g[edge][v] <  k[v])
       {
         parent[v]  = edge, k[v] = g[edge][v];
       }
     }
   }
```

```
        }
            count++;
            count++;
            count++;
        printf("\n Edge \t  Weight\n");
        for (i = 1; i < vertices; i++)
        printf(" %d <-> %d    %d \n", parent[i], i, g[i][parent[i]]);
        count++;
            printf(" time complexity is :%d",count);

}
int main()
{
    int g[vertices][vertices] = {{0, 0, 3, 0, 0},
                        {0, 0, 10, 4, 0},
                        {3, 10, 0, 2, 6},
                        {0, 4, 2, 0, 1},
                        {0, 0, 6, 1, 0},
                        };
    prim(g);
    return 0;
}
```

Output:

38.Write a program to print a minimum and maximum value sequency for all the numbers in a list.

Input a[]=(3, 5, -4, 1, 8, 2, 0, 4)   Output (-4, 8, 0, 5, 1, 4, 3, 2)

Program:

```
#include <stdio.h>
#include <limits.h>
```

```
void printMinMax(int arr[], int n) {
 int i, min, max;

 min = max = arr[0];
 for (i = 1; i < n; i++) {
  if (arr[i] > max)
    max = arr[i];
  if (arr[i] < min)
    min = arr[i];
 }

 for (i = 0; i < n; i++) {
  if (arr[i] == max) {
    printf("%d ", arr[i]);
    max = INT_MIN;
  }
  if (arr[i] == min) {
    printf("%d ", arr[i]);
    min = INT_MAX;
  }
 }
}

int main() {
 int arr[] = {3, 5, -4, 1, 8, 2, 0, 4};
 int n = sizeof(arr)/sizeof(arr[0]);

 printf("The minimum and maximum value sequence is: ");
 printMinMax(arr, n);

 return 0;
}
```

Output:

The minimum and maximum value sequence is: -4 8

39.Write a program to check sub string is there in a string or not.

Input/Output

a.orginal string = "babad"	**b.Orginal string = "babad"**	**c. Orginal string = "babad"**
Sub string = "shahad"	**Sub string = "daa"**	**Sub string = "aba"**
Output = Found	**Output = Not Found**	**Output = Found**

## Program:

```
#include<stdio.h>

int main()
{
    char str[80], search[10];
    int count1 = 0, count2 = 0, i, j, flag;

    printf("Enter a string:");
    gets(str);
    printf("Enter search substring:");
```

```
gets(search);
while (str[count1] != '\0')
    count1++;
while (search[count2] != '\0')
    count2++;
for (i = 0; i <= count1 - count2; i++)
{
    for (j = i; j < i + count2; j++)
    {
        flag = 1;
        if (str[j] != search[j - i])
        {
            flag = 0;
            break;
